Dear Hiring Manager,

I am excited to apply for the **Software Engineer I – Full Stack** position at Rippling. I am currently working as a Solution Analyst, with hands-on experience designing, developing, and deploying production-grade software solutions across backend systems, frontend applications, cloud infrastructure, and AI-powered platforms. I also hold an **AWS Certified Solutions Architect** certification.

In my current role, I work across the complete software development lifecycle, from understanding business requirements and designing technical solutions to backend development, database design, API development, frontend integration, deployment, and production support. I have independently driven complex projects, made technical decisions, and delivered solutions while balancing performance, scalability, reliability, and maintainability.

One of my key projects is an **AI-powered automated quality assurance platform** that I architected and developed across its backend, APIs, database, data-processing, and AI layers. The platform combines Python-based processing, PostgreSQL, business rules, NLP, and LLM-based analysis to automate quality and compliance checks across customer interactions. This experience has strengthened my ability to build integrated production systems, handle complex data flows, troubleshoot operational challenges, and make practical engineering trade-offs.

My technical experience includes **Python, JavaScript, React, Node.js, REST APIs, PostgreSQL, AWS, cloud-based architectures, and AI/ML systems**. I enjoy working across the stack, particularly building reliable backend services while ensuring they translate into effective and intuitive frontend experiences.

What particularly interests me about Rippling is the opportunity to build scalable systems that solve complex enterprise problems while contributing to both backend infrastructure and full-stack product development. The focus on distributed systems, reusable platform capabilities, and technologies such as Python, AWS, and React aligns closely with my experience and the areas in which I want to grow as an engineer.

I would welcome the opportunity to bring my hands-on development experience, ownership mindset, and problem-solving abilities to Rippling's engineering team and contribute to building reliable, scalable products.

Thank you for considering my application.

Kind regards,
Adithya Palamittam
